

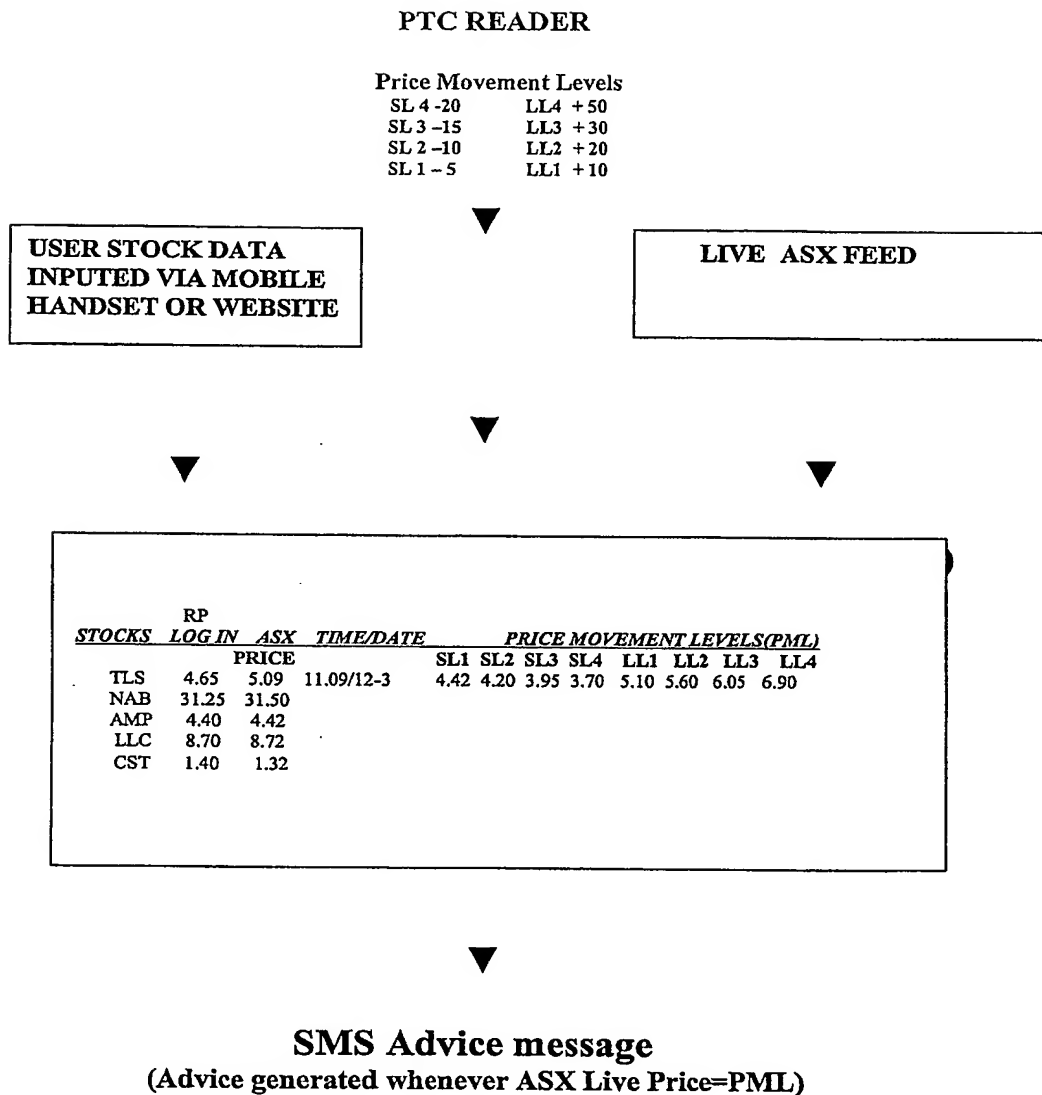

Figure 1:**Flow-line summary of the SafeshareTM SMS DirectTM process:**

1. End-user SMS texts stock codes via a mobile phone to the SafeshareTM SMS DirectTM number i.e. SafeshareTM 1881880
↓
2. PTC Reader /SafeshareTM captures real time price (Reference Price), calculates PMLs ,sets up account, time and date stamps stocks to be monitored
↓
3. PTC Reader searches for price match ups between live exchange data and PMLs and generates SMS advice messages when match-ups are identified
↓
4. PTC Interpreter receives and reads SMS advice message instructions from end-user re status of monitoring See Menu graphics in Figure 1a.

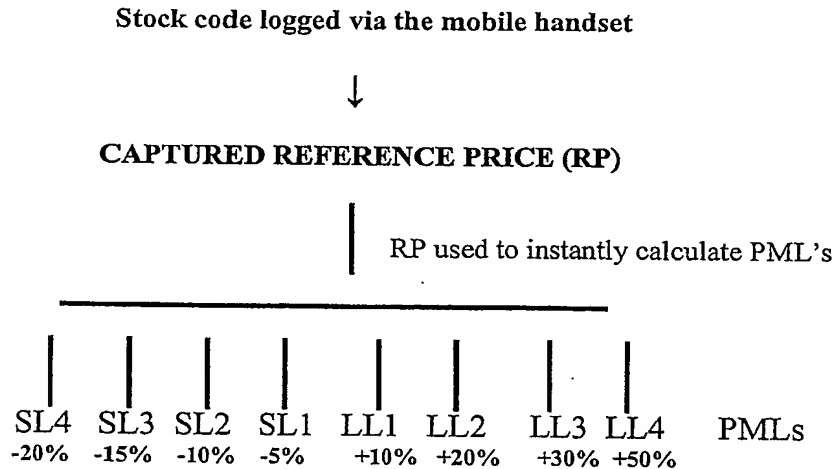

Figure 1a:

**An example of the SMS Advice Message!**

"Safeshare™ Stock Advice! Stock code TLS in your watch portfolio has triggered a key trading (LL1) level. Call your adviser on 0409090780 to discuss. Details www.safeshare.com.au End of Safeshare™ advice message"

Figure 2:**Price movement levels**

A stock code is logged in by the user sending a text message containing the code to SafeshareTM SMS Direct using a mobile handset. The real time price (Reference price) is captured instantly at log in by the PTC Reader and is then used to calculate the PMLs as illustrated below.

The PTC Reader searches for and identifies *price match-ups* between the dynamic exchange data stream and the PMLs and generates SMS Advice messages to the end-user when price match-ups are identified .

Figure 3:

Figure 5:

When $RVL=LDV$, that data figure is used to calculate two more RVL's and the price match-up process continues automatically.

The -5 and +5 represents the % variance to monitor price movement or tolerance level. This value can vary from 0 to 999%.

In the above example, if $RVL-5=LDV$, an SMS advice would be generated and two further RVL's would instantly be calculated and the price match-up between the RVL's and the LDV would continue automatically.
